Vacuum Unit

Ejector System Vacuum Pump System

Air supply is cut-off when vacuum is reached.

Energy saving ejector

Air consumption

3% reduction

Reduced by the pressure switch for vacuum with energy saving function and efficient ejectors

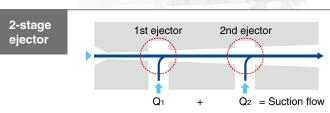

(Under SMC's measurement conditions)

More efficient ejector

Suction flow (Compared to other SMC 1-stage ejectors)

50% increase

Wiring variations

ZK2 A Series

Energy Saving Ejector

Digital pressure switch with energy saving function

reduces air consumption by 90%.*1

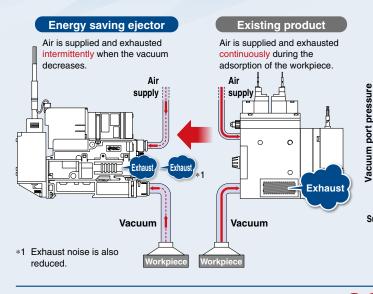

*1 Under SMC's measurement conditions

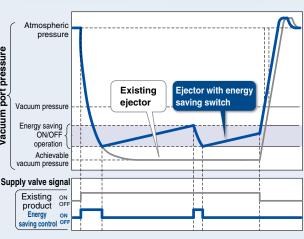

While the suction signal is ON, the ON/OFF operation of the supply valve is also performed automatically within the set value.

More efficient ejector

(Compared to other SMC 1-stage ejectors)

Energy saving efficiency: 93% reduction

Power consumption cost per year reduced by

13,070 JPY/year*1

The energy saving function shortens the exhaust time, which reduces the annual power consumption cost.

With energy)
saving function	J

More efficient ejector

	Power consumption cost per year	Annual air consumption	Exhaust time	Air consumption
ZK2/With energy saving function	957 JPY/year	638 m ³ /year	0.6 s	58 L/min (ANR)
Existing product	14,025 JPY/year	9,350 m ³ /year	6 s	85 L/min (ANR)

*1 Cost conditions

[·] Air unit 1.5 JPY/m³ (ANR), Annual operating cycles: 1100000 (Operating hours: 10 hours/day, Operating days: 250 days/year, 450 cycles/h, when 1 unit is used)

High-noise Reduction Silencer

Improved low noise and suction flow by adoption of a high-noise reduction silencer

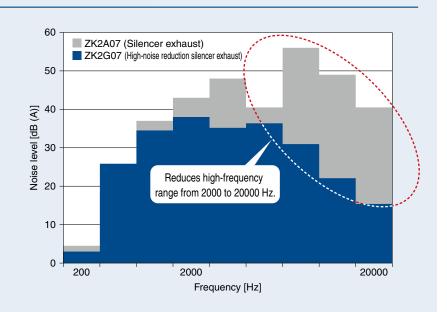

High-noise reduction silencer

Unpleasant frequencies are removed while maximizing vacuum performance by using a dedicated silencer with better silencing effect.

Low noise

46 dB (A)*1

*1 Nozzle size: Ø0.7 (Under SMC's measurement conditions)

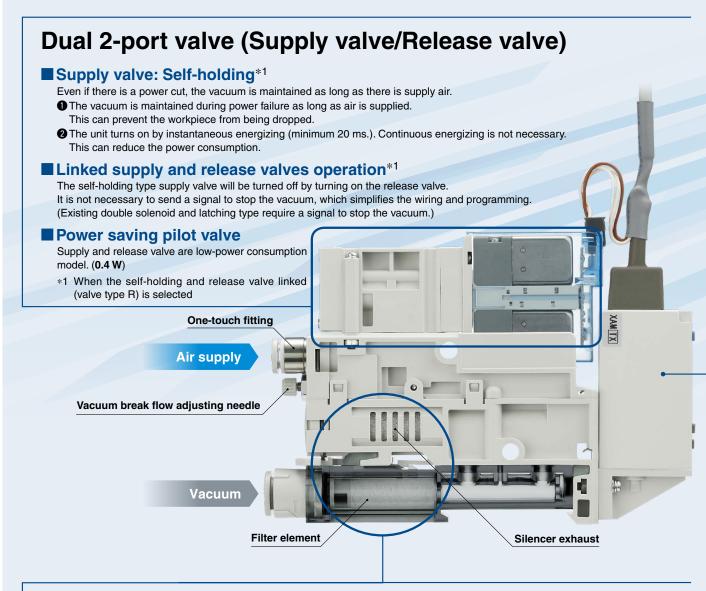

Suction flow

Improved by up to approx. 20%

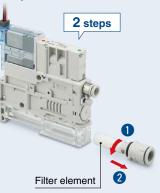

Nozzle size	Exhaust type	Max. suction flow [L/min (ANR)] 40	Approx. 80 20%
ø1.5	High-noise reduction silencer exhaust Silencer exhaust		83

All in One Piping Wiring Installation time reduced!!

Easier maintenance No tools are required for replacement.

■ Replacement of filter element

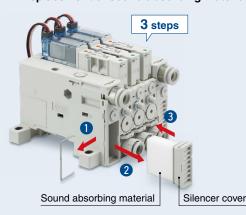

Replacement of filter case

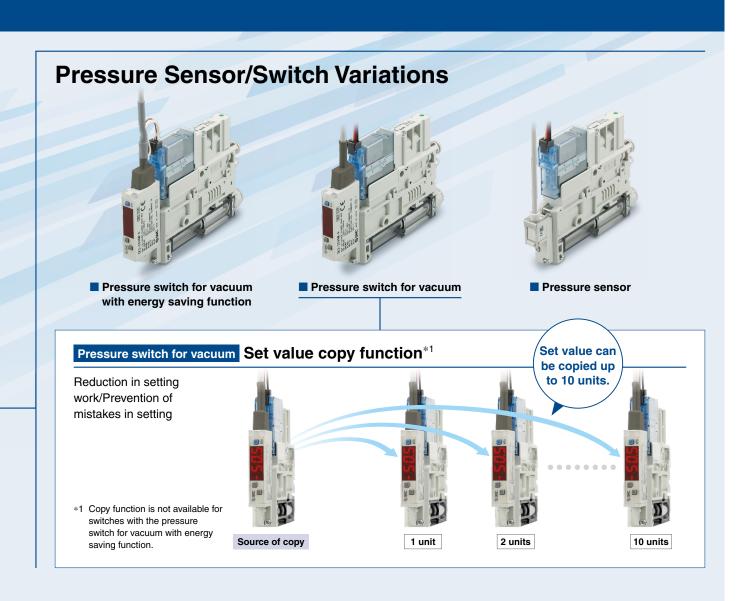

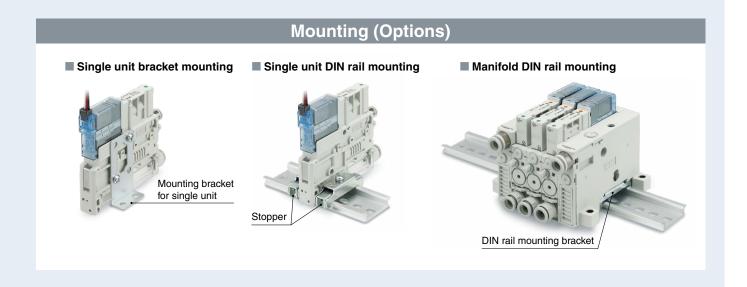

Transparent filter case allows visual check of the contamination. If there is dirt inside the case, it is possible to remove the case and clean it.

■ Replacement of sound absorbing material

The sound absorbing material can be installed/removed without using screws.

ZK2 15 * The following graphs show the characteristics of the ejector with valve. (Please contact SMC for models without valve.)

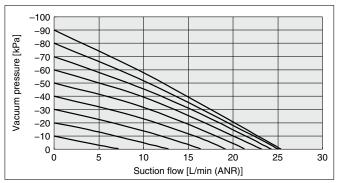

ZK2 A Series

Vacuum Pump System Flow Rate Characteristics/ZK2P00

The graph shows the suction flow rate characteristics of the vacuum pump system at different vacuum pressures.

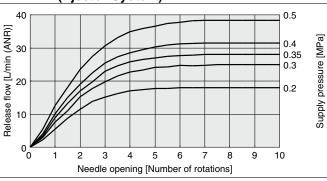

The actual suction flow at the point of suction varies depending on the piping conditions to the vacuum port. (The above graph shows the value when V port is $\emptyset 8$.)

Vacuum Release Flow Rate Characteristics

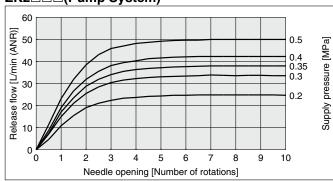

The graph shows the flow rate characteristics at different supply pressures when the vacuum break flow adjusting needle is open from the fully closed state.

ZK2□□□(Ejector System)

The actual suction flow at the point of suction varies depending on the piping conditions to the vacuum port. (The above graph shows the value of the ZK2B07.)

ZK2□□□(Pump System)

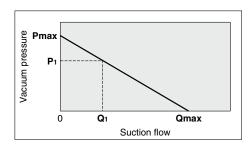

The actual suction flow at the point of suction varies depending on the piping conditions to the vacuum port.

Vacuum Pump System Flow Rate Characteristics of Flow Path and Vacuum Release

Port size		Flow rate characteristics of $V \rightarrow PV$ (Vacuum side)		Flow rate characteristics of PS → V (Vacuum release side)*1			
PV port	V port	C[dm3/(s·bar)]	b	Cv	C[dm3/(s·bar)]	b	Cv
ø6	ø8	0.39	0.14	0.09	0.20	0.06	0.04

*1 When needle is fully open

How to Read the Flow Rate Characteristics Graph

The flow rate characteristics indicate the relationship between the vacuum pressure and the suction flow of the ejector. They also show that when the suction flow changes, the vacuum pressure also changes. In general, this indicates the relationship at the ejector's standard operating pressure. In the graph, **Pmax** indicates the max. vacuum pressure, and **Qmax** indicates the max. suction flow. These are the values that are published as specifications in catalogs, etc. Changes in vacuum pressure are explained in the order below.

- 1. If the ejector's suction port is closed and sealed tight, the suction flow becomes "0," and the vacuum pressure increases to the max. (**Pmax**).
- 2. If the suction port is opened gradually and air is allowed to flow (the air leaks), the suction flow increases, and the vacuum pressure decreases. (The condition of P1 and Q1)
- 3. If the suction port is opened completely, the suction flow increases to the max. (Qmax), while the vacuum pressure then drops almost to "0" (atmospheric pressure).

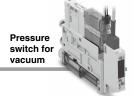

As described above, the vacuum pressure changes when the suction flow changes. In other words, when there is no leakage from the vacuum (V) port, the vacuum pressure can reach its maximum, but as the amount of leakage increases, the vacuum pressure decreases. When the amount of leakage and the maximum suction flow become equal, the vacuum pressure becomes almost zero. When adsorbing workpieces which are permeable, subject to leakage, etc., caution is required as the vacuum pressure will not be very high.

Pressure Sensor/Pressure Switch for Vacuum Specifications

Pressure sensor

Pressure Sensor (For details, refer to the PSE series in the Web Catalog, and the Operation Manual.)

Model (Sen	sor unit: Standard model number)	ZK2-PS1-A (PSE541)	ZK2-PS3-A (PSE543)

- ullet PE: Pilot pressure exhaust port For details \Rightarrow Page 30

Port Layout

System depends on vacuum source (vacuum pump/ejector).

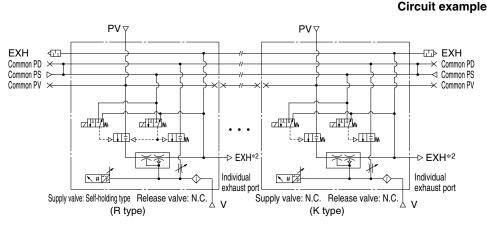

Option -L

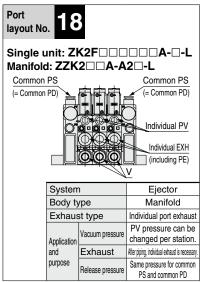

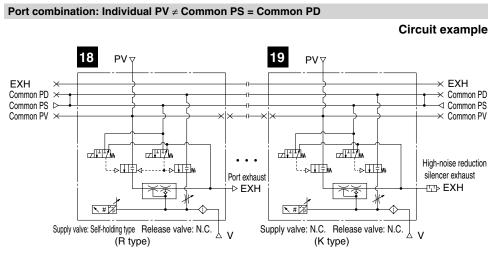

Option -D

*2 For complex exhaust type, individual exhaust port is provided to each station

Refer to page 30 for the purpose of port and the operating pressure range.

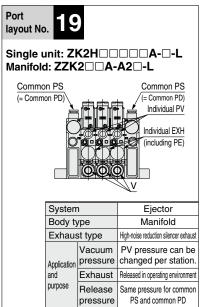

- PV: Air pressure supply port/Port for vacuum source (Vacuum pump)
 PS: Pilot pressure supply port
- PD: Release pressure supply port
 V: Vacuum port
 EXH: Exhaust port
- PE: Pilot pressure exhaust port

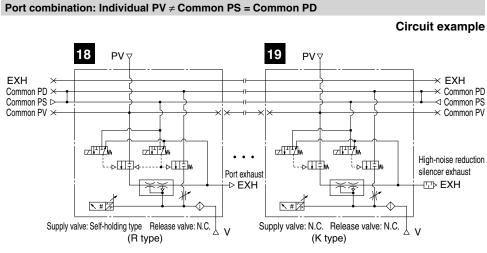

Refer to the table below for details.

Port Layout

System depends on vacuum source (vacuum pump/ejector).

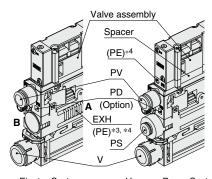

Option -L

Application and Operating Pressure Range of Each Port

Port	Description Ejector system		Vacuum pump system	
	Air pressure supply port	Compressed air supply for operating ejector	_	
PV	(Operating pressure range)	0.3 to 0.6 MPa*1, *2	-	
FV	Vacuum pressure supply port	<u> </u>	Vacuum source (Vacuum pump)	
	(Operating pressure range)	-	0 to -100 kPa	
PS	Pilot pressure supply port	_	Compressed air supply for pilot valve	
го	(Operating pressure range)	<u> </u>	0.3 to 0.6 MPa	
PD	Individual release pressure supply port	Release pressure Compressed air	supply for individual setting (Option)	
FD	(Operating pressure range)	0 to 0.6 MPa (PD ≤ PV)	0 to 0.6 MPa (PD ≤ PS)	
V	Vacuum port	For connecting adsorption	n equipment including pad	
EXH	Exhaust port	Exhaust when ejector operates*3	_	
PE	Pilot pressure exhaust port	Exhaust when v	alve operates*4	

Ejector System

Vacuum Pump System

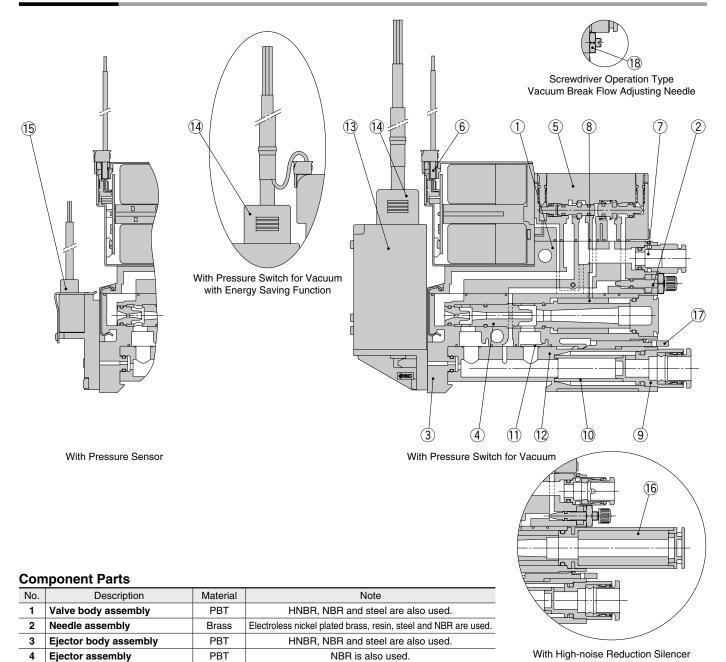

- *1 For models without valve, pressure can be 0.3 MPa or less. (Ejector system)
- *2 Manifold can be used at 0.3 MPa or less when the manifold is for individual SUP. For 0.2 MPa or less, select K or J for the valve type. Set pressure as PV ≤ PS.
- *3 For ejectors with silencer, air exhausts from A (slit on both sides). For port exhaust type, air exhausts from B.
- *4 Pilot pressure for ejectors is exhausted from the ejector and the common exhaust. Vacuum pump system exhausts air from PE port on the spacer. Female thread type (M3) is available by option [C] for PE port of the vacuum pump system.
 - When option [C] is selected for valve type R, operating conditions below apply.
 - Select the type with release pressure supply port (PD) as an option.
 - Single unit/Manifold: Option [D]
 - For Manifold: Option [P]
 - · Vacuum pressure for PV port: -60 to -100 kPa
 - •The energization time of the release valve: 200 ms or longer when the PD port is released to the atmosphere 500 ms or longer when the 0.1 MPa is supplied to the PD port

If the product is used out of this operating condition, please contact your local sales office.

How to remove the The side with Connecto junction box B square hole faces the body Fig. 3 Protrusion of iunction box B Clip in. Fig. 3-A When ordering ejector for vacuum pump system, spacer is included. Gasket Vacuum pump spacer*1 (Part no.: ZK2-SS1-A) End plate D assembly U side Assembled unit Square hole Mark tube Fig. 4 (Station number indication)

■ How to increase manifold stations

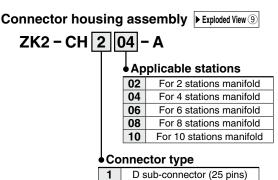

[To increase the number of stations from odd number (1, 3, 5, 7, 9) in common wiring type to even number (2, 4, 6, 8, 10)]

(Common wiring of odd number station has a vacant connector for one station. Easy to add a station.)

- 1) Remove the tension bolt.
- 2) Remove the end plate U.
- 3) Remove the valve assembly of a single unit for extra station(s) for manifold.
- 4) Remove the switch assembly if it is present. (Be careful not to drop the O-ring. Refer to Fig.1)
- 5) Remove the junction box B (top) using a precision screwdriver. (Refer to Fig.2)
- 6) Mount the extra connector to the junction box B. (Refer to Fig.3) (Engage the recess of the connector and the protrusion of the junction box B. (Refer to Fig.3-A)
- 7) Mount a single unit for extra station(s) for manifold to the end surface of U side. (Do not let the gasket or lead wire get caught.)
- 8) Mount the end plate U with the appropriate length of tension bolts for the number of stations required. (Tightening torque: 0.75 N·m.)
- 9) Mount the junction box B to the junction box A.
- 10) Assemble the valve assembly. (Tightening torque: 0.15 N·m)
- 11) For products with a switch, mount the switch assembly. (Be careful not to drop the O-ring. Tightening torque: 0.08 to 0.10 N·m)

[To increase the number of stations from even number to odd number, or increase two stations or more]

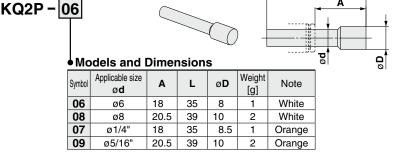

- 1) Remove the valve assembly for all stations. (Single unit for extra station is also removed.)
- 2) Remove the switch assembly if it is present. (Be careful not to drop the O-ring. Refer to Fig.1)
- 3) Remove the junction box B (top) for all stations using a precision screwdriver. (Refer to Fig.2) (Remove the junction box B from D side.)
- 4) Remove all connectors mounted to the junction box B. (Be careful not to break the connector clip.)
- 5) Remove the tension bolt.
- 6) Remove the end plate D assembly.
- 7) Remove the connector housing assembly from the end plate D assembly. (Refer to **Fig.4**)
- 8) Mount the connector housing assembly for extra station(s) to the end plate D assembly. (Refer to **Fig.4**) (Insert two clips of the housing mounting surface to the square holes of the end plate, and slide the connector housing assembly.)
- 9) Remove the end plate U. (Be careful not to drop the gasket.)
- 10) Mount a single unit for extra station(s) for manifold to the end surface of U side. Do not let the gasket get caught.
- 11) Mount the end plate U and D with the appropriate length of tension bolts for the number of stations required. (Tightening torque: 0.75 N·m.)
- 12) Mount the connector for all stations to the junction box B. (Refer to Fig.3) (Engage the recess of the connector and the protrusion of the junction box B. (Refer to Fig.3-A)
- 13) Mount the junction box A to the junction box B. Push the wires down the side and mount the junction box A to the junction box B following a decreasing mark tube numbers from U side. (Do not let the lead wire get caught.)
- 14) Assemble the valve assembly. (Tightening torque: 0.15 N·m)
- 15) For products with a switch, mount the switch assembly. (Be careful not to drop the O-ring. Tightening torque: 0.08 to 0.10 N-m)
- *1 When adding a vacuum pump system, the vacuum pump spacer for extra station is required separately.

2 Flat ribbon cable connector (26 pins)

■ Plug (For One-touch fitting) (Purchasing order is available in units of 10 pieces.)

Mounted onto ports which are not used (PV, PS, PD, etc.)

L6	85.5	110.5	123	135.5	148	160.5	185.5	198	210.5	223

- *1 Common pilot pressure supply (PS) port is available for vacuum pump system or option L (Manifold individual supply specification). (mm: ø6 inch: ø1/4")
 *2 Vacuum pump system with individual exhaust port type does not have exhaust port.
 *3 When individual exhaust port type is selected (Body type: F)
 *4 Only when common PD port type option (Symbol: -D) is selected (mm: ø6 inch: ø1/4")
 *5 To fix the manifold to DIN rail, select an option for the manifold model number.

- *6 Applicable connector: Connector for flat ribbon cable (26P)(MIL-C-83503 compliant)
 *7 For complex exhaust type, air is also exhausted from the individual exhaust port of each station in addition to the common exhaust. (Ejector system)

Electrical Wiring Specifications

A D-sub connector (25P) conforming to MIL standards is used.

A flat ribbon cable connector (26P) conforming to MIL standards is used.

Optional Specifications/Functions/Applications

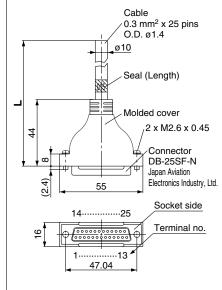

Symbol			Туре	Function/Application
В	Mounting brack (nuts and bolts	ket for single unit are included)	Bracket	· Use when a single unit is mounted to the floor in an upright position is requested. (When ordering only bracket, refer to page 38.)
С		system PE port specification (M3)	PE port	Use for pilot pressure exhaust piping (Standard vacuum pump system is released to the atmosphere.)
D	With individual supply (PD) po	release pressure rt (M3)	PD port	Use when supply pressure for vacuum release is individually requested.
E		Screwdriver operation type long lock nut	Screwdriver operation type long lock nut	Used when the port position is close to the manifold individual supply and the needle adjustment operation is difficult
J	Vacuum break flow adjusting needle	Round lock nut	Lock nut	Thicker than standard hexagon type. More suitable for hand tightening. Round lock nut improves operability when manifold, vacuum pump system, or exhaust port type is used.
K		Screwdriver operation type	Vacuum break flow adjusting needle	· Slotted type improves fine adjustment performance when manifold, vacuum pump system, or exhaust port type is used.
L	Manifold individual supply specific		Individual supply port	Adjust the supply pressure individually for manifold in order to adjust the vacuum pressure reached by each ejector.
Р	With manifold common release pressure supply (PD) port			· When selecting "D" (with common release pressure supply (PD) port) for manifold option, supplying a pressure which is different from for common PV to common PD is requested.
w	With exhaust in prevention valv		Exhaust interference prevention valve	· When ejectors are operated individually, exhausted air may flow backward from the V port of ejectors that are turned off. Exhaust interference prevention valve prevents backflow.

Be sure to read this before handling the products. Refer to the back cover for safety instructions. For vacuum equipment precautions, refer to the "Handling Precautions for SMC Products" and the "Operation Manual" on the SMC website: https://www.smcworld.com

Supply Valve / Release Valve

1. Manual override operation

 Manual override is non-locking push type. Push the manual override with a screwdriver of a diameter smaller than indicated in the diagram until it reaches the end.

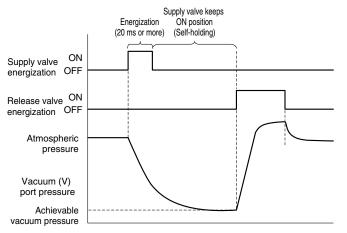

- Confirm that the product operates safely before the manual override is operated.
- * When the valve type R is selected, the supply valve can hold the position and will not switch off even if the supply valve manual override operation is finished unless the release valve manual override is pressed.

2. Self-holding function of supply valve (Valve type R)

When the supply valve is energized (20 ms or more), the supply valve keep ON position even after energization is stopped. When release valve is energized, the supply valve is turned off in conjunction with the operation of the release valve.

- * Main valve in the valve assembly is made of elastic seal. Self-holding is performed by friction resistance of the seal. Do not apply impact resistance in the direction of the main valve shaft during the installation to moving parts. When impact is applied, use valve type K. (For vibration and impact, refer to the General Specifications on page 18.)
- * In a vacuum pump system, the workpiece may not be released when the vacuum break flow adjusting needle is closed during the use. In addition, the OFF operation of the supply valve may become unstable. Open the vacuum break flow adjusting needle during use.
 - If the vacuum break flow adjusting needle is expected to close during use due to a light workpiece, please select PD port type (single unit: manifold option [D] (for manifold: option [P])). Release the PD port to the atmosphere and open the vacuum break flow adjusting needle.
- Valve type R cannot use a pressure switch for vacuum with energy saving function. Use valve type K.

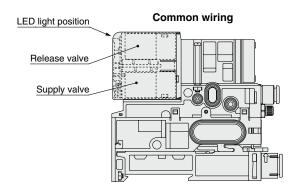

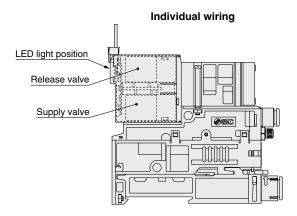

3. Default setting

When the valve assembly is delivered, the supply valve is on the OFF position, but it may be on the ON position due to the vibration or impact during transportation or device installation. Turn to the OFF position manually or by energizing before use.

4. LED indication

Red LED turns on when supply valve is energized. Green LED turns on when release valve is energized.

5. Continuous duty

If a supply valve is energized continuously for a long time, the rise in temperature due to heat-up of the coil may cause a decline in solenoid valve performance, reduce service life, or have adverse effects on peripheral equipment. When the energizing time per day is longer than non-energizing time, use the self-holding function of valve type R. (Energized time should be 20 ms or longer, and be as short as possible.)

Be sure to read this before handling the products. Refer to the back cover for safety instructions. For vacuum equipment precautions, refer to the "Handling Precautions for SMC Products" and the "Operation Manual" on the SMC website: https://www.smcworld.com

Surge Voltage Intrusion

⚠ Caution

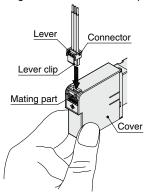

The surge voltage created when the power supply is cut off could apply to the de-energized load equipment through the output circuit. In cases where the energized load equipment has a larger capacity (power consumption) and is connected to the same power supply as the product, the surge voltage could malfunction and/or damage the internal circuit element of the product and the internal device of the output equipment. To avoid this situation, place a diode which can suppress the surge voltage between the COM lines of the load equipment and output equipment.

Wiring

⚠ Caution

1. Individual wiring

- To install the connector, hold the cover and insert the connector straight pushing the connector lever with your finger. Ensure that the connector lever clip is properly inserted onto mating part.
- To remove the connector, hold the cover and pull out the connector straight pushing the connector lever clip.

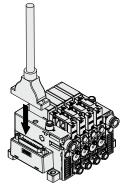

* Do not pull the lead wire with a force of 25 N or more, as this may damage the connector or cover.

2. Common wiring

 Align the socket connector of the cable and the plug connector of the manifold.

Insert the socket connector of the cable into the plug connector of the manifold vertically. If the connector is pushed forcibly, the pin will bend and the connector cannot be joined.

Example) D-sub connector

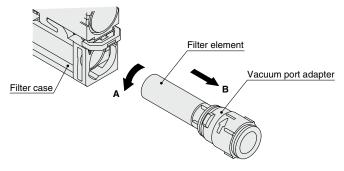

Replacement Procedure

⚠ Caution

1. Replacement Procedure for Filter Element

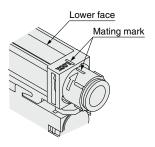

- To pull out the vacuum port adapter, rotate the adapter by about 90 degrees in direction A and pull in direction B. The adapter can be removed with the suction filter from the filter case.
- 2) Remove the suction filter from the vacuum port adapter and replace it with a new suction filter.

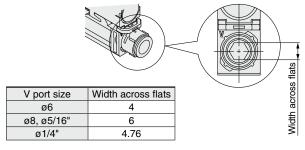

3) When installing the filter, insert the filter to the end so that there is no gap*1 or bending*2 between the filter and the vacuum port adapter. The gap or bending will cause the element to deform inside the case.

- 4) Put the filter back into the filter case following this procedure in reverse
- To mount the vacuum port adapter into the filter case, turn the adapter so that the mating mark of the adapter and the case are aligned. (Rotation stops there.)

If it is difficult to remove the vacuum port adapter, you can remove the adapter with a hexagon wrench using the hexagonal hole in V port. The table shows the port size and the width across flats.

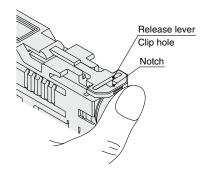

Be sure to read this before handling the products. Refer to the back cover for safety instructions. For vacuum equipment precautions, refer to the "Handling Precautions for SMC Products" and the "Operation Manual" on the SMC website: https://www.smcworld.com

Replacement Procedure

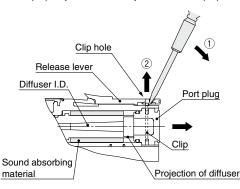

∧ Caution

2. Replacement Procedure for Sound Absorbing Material (for Silencer Exhaust)

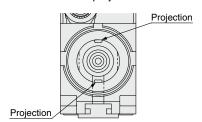

- 1) Remove the filter case following 5 the procedure of filter case maintenance (page 47).
- 2) Flip the ejector, push the release lever again with a finger or precision screwdriver until the release lever stops.

3) To remove the clip that holds the port plug, insert a precision screwdriver from the release lever notch. Move the screwdriver in direction (1) to pull out the clip in direction (2).

- 4) Remove the port plug.
- 5) Remove the sound absorbing material from the slit (hole) at the side of the body by using a precision screwdriver.
- 6) Insert the new sound absorbing material. Be careful not to scratch the material with the projection of the diffuser assembly.

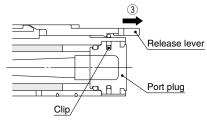

Diffuser hole viewed from the port plug

(Procedure to put parts back together)

- 7) Insert the port plug and insert the clip into the groove using the lever hole. (Push completely to the end.)
 - * Do not pull or bend the two projections at the end surface of the diffuser. These are spacers to prevent the displacement of the diffuser and they may break if force is applied.

8) Return the release lever in direction of 3 until it stops.

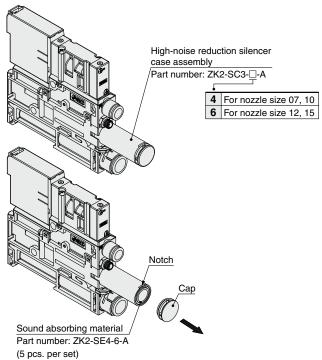

3. Replacement Procedure for High-noise Reduction Silencer Case Assembly

Refer to the replacement procedure of the sound absorbing material (silencer exhaust) to replace the assembly.

* When a high-noise reduction silencer case assembly is attached to body type "A" (silencer exhaust), the silencing effect cannot be acquired.

When only replacing the sound absorbing material (for high-noise reduction silencer exhaust)

- 1) Use the notch to remove the cap.
- Use a precision screwdriver to remove the sound absorbing material.
- 3) Insert the new sound absorbing material, and return the cap.

4. Replacement Procedure for Manifold Sound Absorbing Material

Replacement Procedure

- 1) Insert a precision screwdriver to notch **A** of the end plate and remove a clip L ①.
- 2) Insert a precision screwdriver to notch **B** and remove the silencer cover ②.
- 3) Pull out the sound absorbing material from the silencer cover ③.
- 4) Mounting of a new sound absorbing material should be performed by following the removal procedure in reverse.

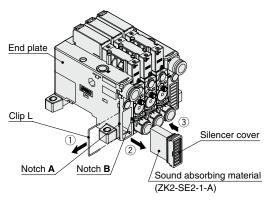

\triangle

ZK2□A Series Specific Product Precautions 4

Be sure to read this before handling the products. Refer to the back cover for safety instructions. For vacuum equipment precautions, refer to the "Handling Precautions for SMC Products" and the "Operation Manual" on the SMC website: https://www.smcworld.com

Replacement Procedure

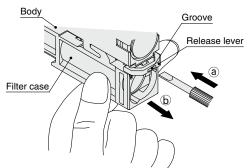

⚠ Caution

 Ejector system manifold common exhaust type has a sound absorbing material in the end plate. If the sound absorbing material is clogged, ejector performance is deteriorated, leading to suction failure or response delay. Regular replacement of the sound absorbing material is recommended.

5. Filter case maintenance

1) When the filter case is dirty, it can be removed and cleaned. To remove the filter case, insert a precision screwdriver into the groove of the release lever and push in direction (ⓐ), and slide the filter case in direction (ⓑ).

 Surface A of the filter case is the sealing surface when vacuum is generated. Handle with care so that the surface is not scratched or damaged.

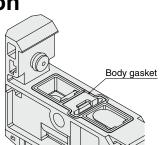

- * Filter case is made of polycarbonate. Avoid chemicals such as thinner, carbon tetrachloride, chloroform, acetic ester, aniline, cyclohexane, trichloroethylene, sulfuric acid, lactic acid, water base cutting fluid (alkaline).
- * Do not expose the filter case to direct sunlight for a long period of time.

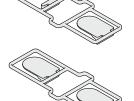

(Procedure to put parts back together)

2) Make sure that the body gasket that matches the product specifications is installed correctly onto the ejector. If they are out of the place, vacuum leakage may occur.

Replacement Procedure

^ Caution

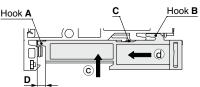

One check valve type

(All specifications other than switch with energy saving function and exhaust interference prevention valve)

Two check valve type

(Switch with energy saving function and exhaust interference prevention valve)

- 3) Push the filter case in direction (©). Be careful the filter case hook (**A**) and hook (**B**) do not touch the body of the ejector.
- 4) Slide the filter case in direction (d) while pushing the filter case gently in contact with the ejector. Make sure that the clip (C) is locked and there is no gap in part (D).

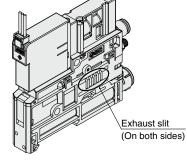

If excess force is applied to the filter case, hook A and B may break.
 Handle with care

Ejector Exhaust / Exhaust Noise

▲ Caution

■ Ejector Exhaust

• The exhaust resistance should be as small as possible to obtain the full ejector performance. There should be no shield around the exhaust slit for silencer exhaust type. When the product is installed, one of the exhaust slits should be open to atmosphere.

Be sure to read this before handling the products. Refer to the back cover for safety instructions. For vacuum equipment precautions, refer to the "Handling Precautions for SMC Products" and the "Operation Manual" on the SMC website: https://www.smcworld.com

Ejector Exhaust / Exhaust Noise

⚠ Caution

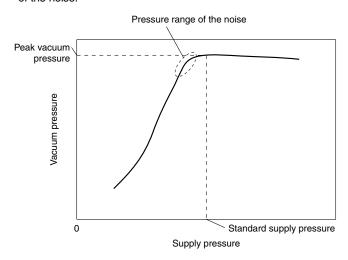

For the port exhaust specification, back pressure may increase depending on the size and length of the piping connected to the exhaust (EXH) port. Ensure that the back pressure does not exceed 0.005 MPa (5 kPa). Do not operate the ejector or apply pressure to the exhaust port with the exhaust port closed. This increases the pressure in the product and can damage the vacuum ejector.

If the sound absorbing material is clogged, it will cause a reduction in the ejector performance.
 Sometimes if the operating environment contains a lot of parti-

Sometimes, if the operating environment contains a lot of particles or mist, the replacement of the filter element only is not enough to recover vacuum performance - as the sound absorbing material may be clogged. Replace the sound absorbing material. (Regular replacement of the filter element and the sound absorbing material is recommended.)

■ Exhaust Noise

• When vacuum ejector generates vacuum, noise can be heard from the exhaust port when the standard supply pressure is close to the pressure that generates peak vacuum pressure making vacuum pressure unstable. If the vacuum pressure range is adequate for adsorption, there should not be a problem. If the noise causes a problem or affects the setting of the pressure switch, change the supply pressure slightly to avoid the pressure range of the noise.

Operating Supply Pressure

Use the product within the specified supply pressure range.
 Operation over the max. operating pressure can cause damage to the product.

The parts around the vacuum port of this product are designed to be used with vacuum pressure. With the vacuum pump system, since air is not released to the atmosphere from a silencer, the applied air for vacuum release increases the internal pressure of the vacuum port. Select the vacuum pad which shape allows smooth exhaust of release air to the atmosphere and avoid clogging.

Port Size

⚠ Caution

■Single Unit

 The sizes of the each port are as follows. (Refer to the Application and Operating Pressure Range of Each Port on page 30.)

	Size						
Port	Eject	or system	Vacuum pump system				
	Metric	Inch	Metric	Inch			
PV	ø6	ø1/4"	ø6	ø1/4"			
V	ø6, ø8	ø1/4", ø5/16"	ø6, ø8	ø1/4", ø5/16"			
EXH (Port exhaust)	ø8	ø5/16"	_	_			
PE	EXH	EXH Common		o atmosphere *1			
PS	_	_	ø4	ø5/32"			
PD *2	МЗ	_	М3	_			

- —: Not applicable
- *1 Air is also exhausted from the pilot valve when the valve type is R. Piping for PE port is available as an option (M3). (Refer to pages 15 and 16.)
- *2 A model with PD port is available as an option. (Refer to pages 9, 10, and 15.)

■ Manifold

- Manifold ports are common at the end plate. Port description and application are the same as the single unit. (Refer to the Application and Operating Pressure Range of Each Port on page 30.)
- Refer to page 18 for the number of stations that can operate simultaneously for each ejector size.
- If one side is not used for air supply, plug the unused port or change to the dedicated port plug assembly as shown below.

	Standard	Port plug assembly
Common PV port	ø8 One-touch fitting	VVQZ2000-CP
Common PS port	ø6 One-touch fitting	ZK2-MP1C6-A
Common PD port	96 One-louch litting	ZNZ-IVIP I CO-A

* There are 4 types of port combination due to the manifold port specification.

	Common EXH port	Common PS/PD ports	Application
ZZK2□A-A□1□	Yes	PS = PD	Ejector common exhaust PV = PS = PD
ZZK2□A-A□1□-D	Yes	PS ≠ PD	Ejector common exhaust PV = PS ≠ PD
ZZK2□A-A□2□	None	PS = PD	Ejector individual exhaust PV = PS = PD
ZZK2□A-P2□	None	13-15	Vacuum pump system PV ≠ PS = PD
ZZK2□A-A□2□-D	None	PS ≠ PD	Ejector individual exhaust PV = PS ≠ PD
ZZK2□A-P2□-D	inone	FJ≠FD	Vacuum pump system PV ≠ PS ≠ PD

- When PS = PD, the common PS/PD ports on the end plate are used, PS port is equipped with One-touch fitting and PD port is plugged at the time of shipment from the factory. Since the PS and PD are connected inside the end plate, common supply location can be changed by exchanging the One-touch fitting and the plug.
- When PS ≠ PD, PS and PD are not connected inside the end plate. (It is necessary to supply each port individually.)

\triangle

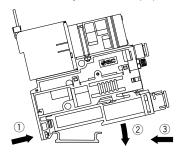

ZK2□A Series Specific Product Precautions 6

Be sure to read this before handling the products. Refer to the back cover for safety instructions. For vacuum equipment precautions, refer to the "Handling Precautions for SMC Products" and the "Operation Manual" on the SMC website: https://www.smcworld.com

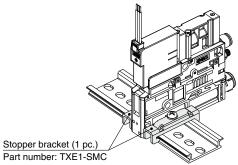

How to Mount a Single Unit

Caution

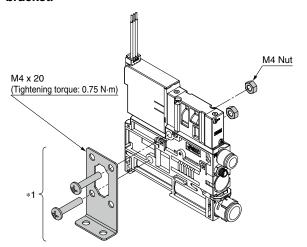

- 1. Single unit can be mounted to DIN rail or wall using the holes in the body (2 x \emptyset 4.5).
 - When mounting the ejector to DIN rail, unlock the filter case assembly beforehand. (Refer to the maintenance procedure on page 47.)
 - Hook the ejector onto the DIN rail from direction (1).
 - Mount the ejector onto the DIN rail by pushing it down in direction (2).
 - Push the filter case assembly in direction (3) until it is locked.

• To hold the ejector onto the DIN rail, hold it from both sides using the stopper brackets.

To mount a single unit onto the floor, use the optional bracket.

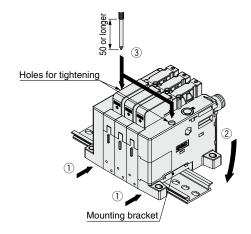

*1 Mounting bracket for single unit (Option), [Nuts and bolts are included.] Part number: ZK2-BK1-A

How to Mount a Manifold

∧ Caution

- Manifolds can be mounted onto the floor using M4 holes on the end plate.
- It is possible to mount the manifold onto the DIN rail by manifold option.
- · Hook the mounting bracket of the end plate to DIN rail from direction (1).
- · Mount the ejector onto the DIN rail by pushing it down in direction (2).
- · Use a 50 mm or longer Phillips screwdriver to tighten the mounting bracket (\Im). (Tightening torque: 0.9 ±0.1 N·m)
- Removal should be performed by following the mounting procedure in reverse.

Vacuum Break Flow Adjusting Needle

⚠ Caution

1. The flow rate characteristics show the representative values of the product itself.

They may change depending on piping, circuit and pressure conditions, etc. The flow rate characteristics and the number of needle rotations vary due to the range of the specifications of the product.

2. The needle has a retaining mechanism, so it will not turn further when it reaches the rotation stop position.

Turning the needle too far may cause damage.

3. Do not tighten the handle with tools such as nippers.

This can result in breakage due to idle turning.

4. Do not over tighten the lock nut.

It is possible to tighten the standard lock nut (hexagon) manually. When tightening further with tools, tighten by approximately 15° to 30°. Over tightening may cause breakage.

When vacuum break flow adjusting needle screwdriver operation type (-K) is selected as option, make sure the lock nut is not loose to prevent the nut from coming off due to vibration.

Be sure to read this before handling the products. Refer to the back cover for safety instructions. For vacuum equipment precautions, refer to the "Handling Precautions for SMC Products" and the "Operation Manual" on the SMC website: https://www.smcworld.com

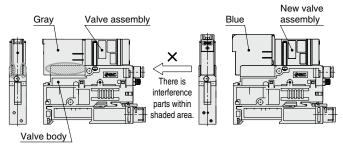

Interchangeability with Existing Product

∧ Caution

When existing product is used, please be careful with the interchangeability between existing product in the table below and $ZK2\square A$.

○Single Unit

 New valve assembly of ZK2□A cannot be assembled with the existing products. (Pilot valve dimension and valve body dimension are different.)

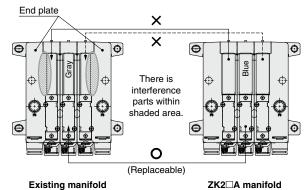

Existing product

ZK2□A

Manifold of 3 stations or more

 Single unit of ZK2□A for manifold cannot be assembled with the existing manifold. (Pilot valve dimension and end plate dimension are different.)

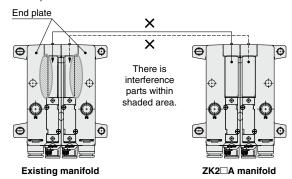

By replacing the manifold end plate assembly with the manifold end plate for ZK2 \square A, a single unit of ZK2 \square A for manifold can be assembled. Manifold end plate assembly number (Refer to page 33.)

OManifold of 1 or 2 stations

 A single unit ZK2□A for manifold cannot be assembled with the existing manifold.

(Pilot valve dimension and end plate dimension are different.)

OReplacement of the check valve

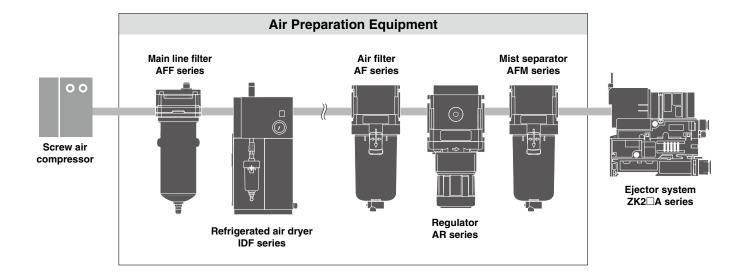

• The check valve and the gasket are separate parts for the conventional product, but ZK2□A is not interchangeable because it is integrated.

Quality of Supply Air

Supply air containing foreign matter, water, oil, condensate, etc., can cause malfunction of the supply valve and release valve. So, install air preparation equipment on the upstream side of the product (refer to the piping example below) and perform maintenance periodically to control the supply air properly.

⚠ Safety Instructions

These safety instructions are intended to prevent hazardous situations and/or equipment damage. These instructions indicate the level of potential hazard with the labels of "Caution," "Warning" or "Danger." They are all important notes for safety and must be followed in addition to International Standards (ISO/IEC)*1), and other safety regulations.

Caution: Caution indicates a hazard with a low level of risk which, If not avoided, could result in minor or moderate injury.

Warning: Warning indicates a hazard with a medium level of risk which, if not avoided, could result in death or serious injury.

⚠ Danger: Danger indicates a nazaru wiun a nigin level on the first avoided, will result in death or serious injury. **Danger** indicates a hazard with a high level of risk which, *1) ISO 4414: Pneumatic fluid power - General rules relating to systems.

ISO 4413: Hydraulic fluid power – General rules relating to systems.

IEC 60204-1: Safety of machinery - Electrical equipment of machines. (Part 1: General requirements)

ISO 10218-1: Manipulating industrial robots - Safety.

⚠ Warning

1. The compatibility of the product is the responsibility of the person who designs the equipment or decides its specifications.

Since the product specified here is used under various operating conditions, its compatibility with specific equipment must be decided by the person who designs the equipment or decides its specifications based on necessary analysis and test results. The expected performance and safety assurance of the equipment will be the responsibility of the person who has determined its compatibility with the product. This person should also continuously review all specifications of the product referring to its latest catalog information, with a view to giving due consideration to any possibility of equipment failure when configuring the equipment.

2. Only personnel with appropriate training should operate machinery and equipment.

The product specified here may become unsafe if handled incorrectly. The assembly, operation and maintenance of machines or equipment including our products must be performed by an operator who is appropriately trained and experienced.

- 3. Do not service or attempt to remove product and machinery/ equipment until safety is confirmed.
 - 1. The inspection and maintenance of machinery/equipment should only be performed after measures to prevent falling or runaway of the driven objects have been confirmed.
 - 2. When the product is to be removed, confirm that the safety measures as mentioned above are implemented and the power from any appropriate source is cut, and read and understand the specific product precautions of all relevant products carefully.
 - 3. Before machinery/equipment is restarted, take measures to prevent unexpected operation and malfunction.
- 4. Contact SMC beforehand and take special consideration of safety measures if the product is to be used in any of the following conditions.
 - 1. Conditions and environments outside of the given specifications, or use outdoors or in a place exposed to direct sunlight.
 - 2. Installation on equipment in conjunction with atomic energy, railways, air navigation, space, shipping, vehicles, military, medical treatment, combustion and recreation, or equipment in contact with food and beverages, emergency stop circuits, clutch and brake circuits in press applications, safety equipment or other applications unsuitable for the standard specifications described in the product catalog.
 - 3. An application which could have negative effects on people, property, or animals requiring special safety analysis.
 - 4. Use in an interlock circuit, which requires the provision of double interlock for possible failure by using a mechanical protective function, and periodical checks to confirm proper operation.

⚠ Caution

1. The product is provided for use in manufacturing industries.

The product herein described is basically provided for peaceful use in manufacturing industries.

If considering using the product in other industries, consult SMC beforehand and exchange specifications or a contract if necessary.

If anything is unclear, contact your nearest sales branch.

Limited warranty and Disclaimer/ **Compliance Requirements**

The product used is subject to the following "Limited warranty and Disclaimer" and "Compliance Requirements".

Read and accept them before using the product.

Limited warranty and Disclaimer

- 1. The warranty period of the product is 1 year in service or 1.5 years after the product is delivered, whichever is first.*2) Also, the product may have specified durability, running distance or
 - replacement parts. Please consult your nearest sales branch.
- 2. For any failure or damage reported within the warranty period which is clearly our responsibility, a replacement product or necessary parts will be provided. This limited warranty applies only to our product independently, and not to any other damage incurred due to the failure of the product.
- 3. Prior to using SMC products, please read and understand the warranty terms and disclaimers noted in the specified catalog for the particular products.
 - 2) Vacuum pads are excluded from this 1 year warranty.

A vacuum pad is a consumable part, so it is warranted for a year after it is delivered.

Also, even within the warranty period, the wear of a product due to the use of the vacuum pad or failure due to the deterioration of rubber material are not covered by the limited warranty.

Compliance Requirements

- 1. The use of SMC products with production equipment for the manufacture of weapons of mass destruction (WMD) or any other weapon is strictly prohibited.
- 2. The exports of SMC products or technology from one country to another are governed by the relevant security laws and regulations of the countries involved in the transaction. Prior to the shipment of a SMC product to another country, assure that all local rules governing that export are known and followed.

⚠ Caution

SMC products are not intended for use as instruments for legal metrology.

Measurement instruments that SMC manufactures or sells have not been qualified by type approval tests relevant to the metrology (measurement) laws of each country. Therefore, SMC products cannot be used for business or certification ordained by the metrology (measurement) laws of each country.
